Education

KIET Group Of Institutions

Bachelor of Technology in Computer Science Engineering

Ghaziabad

November 2021 - August 2025

Experience

TECHNOHUNK

DevOps & Cloud Engineer

Ghaziabad

January 2026 - Present

- Owned and managed cloud infrastructure on **AWS (EC2, VPC, RDS, S3)** using **Terraform**, codifying infrastructure as reusable modules to keep dev/staging/prod environments consistent and cutting environment provisioning time by 70%.
- Containerized 10+ microservices using **Docker**, reducing deployment time by 30% and environment inconsistencies by 25% through optimized Dockerfiles and **Docker Compose**.
- Implemented observability using **Prometheus, Grafana, Grafana Loki, and Jaeger**, unifying metrics, logs, and distributed traces, and reducing Mean Time To Detect (MTTD) by 40% through threshold-based alerting and real-time dashboards.
- Collaborated with development teams to troubleshoot infrastructure and pipeline issues in staging/production, improving overall deployment reliability across AWS-hosted services.

Projects

Projects at Technohunk

- Owned cloud infrastructure and CI/CD for a microservices-based Hospital Management System, provisioning AWS resources (EC2, VPC, RDS) with Terraform and building automated pipelines across GitLab CI/CD and Jenkins for build, test, and deployment
- Reduced deployment time by 40% and environment provisioning from days to under 30 minutes by codifying infrastructure as Terraform modules and automating release workflows end-to-end.

3-Tier Cloud Infrastructure on AWS using Terraform

- Designed and provisioned a highly available 3-tier architecture on **AWS** using **Terraform** — custom VPC across multiple AZs, an **ALB**-fronted **EC2** and a Multi-AZ **RDS** database tier.
- Achieved 99.95% uptime with automated failover and cut full environment provisioning to under 20 minutes via a single terraform apply, versus days of manual setup.

Full-Stack Observability Platform using OpenTelemetry, Prometheus, Loki, Jaeger & Grafana

- Instrumented services with **OpenTelemetry** for unified metrics, logs, and distributed tracing, backed by **Prometheus, Grafana Loki, and Jaeger**, all visualized through **Grafana** dashboards.
- Cut Mean Time To Detect (MTTD) by 45% and root-cause analysis time by 50% by correlating traces, logs, and metrics instead of debugging each in isolation.

Application Deployment Automation using Ansible

- Built a 4-role **Ansible** automation suite that provisions a bare **Ubuntu server** into a fully running, health-checked production environment — **Java 21, Docker** and a containerized **Spring Boot + MySQL** app — via a single **ansible-playbook** command.
- Cut manual server setup time by 90% and eliminated inventory drift on autoscaled fleets using AWS EC2 dynamic inventory with tag-based filtering.

Technical Skills

Languages: Python, JAVA, SQL

AWS Services: EC2, S3, IAM, Lambda, DynamoDB, RDS, VPC, Route 53, EBS, API Gateway, ECR, CloudWatch

CI/CD : Jenkins, GitHub Actions, Gitlab CICD

Infrastructure as Code & Configuration Management: Terraform, Ansible

Containerization & Monitoring: Kubernetes(Basics), Docker

OS & Tools : Linux, Git, Github , Gitlab, Nginx, Postman, MongoDB, Spring Boot

Observability: Prometheus, Loki, Jaegar, Opentelemetry, Grafana, Alert Manager
